Root Cause

The browser must download, parse, and execute certain CSS/JS files **before it paints anything** on screen. Every millisecond spent waiting is added to your FCP and LCP.

Fix 1: Eliminate Render-Blocking CSS

Option A — Inline Critical CSS (Best for LCP)

1. Use a tool like [Critical](#) or [Penthouse](#) to extract above-the-fold CSS
2. Inline it directly in <head>:

```
<head>
<style>
  /* Critical CSS: header, hero, fonts, layout */
  body{margin:0;font-family:...}
  .hero{...}
</style>
<!-- Load full CSS asynchronously -->
<link rel="preload" href="/styles.css" as="style"
onload="this.onload=null;this.rel='stylesheet'">
<noscript><link rel="stylesheet" href="/styles.css"></noscript>
</head>
```

Fix 2: Eliminate Render-Blocking JavaScript

```
<!-- DEFER: Download early, execute after HTML parse (keeps order) -->
<script src="/app.js" defer></script>

<!-- ASYNC: Download early, execute immediately when ready -->
<script src="/analytics.js" async></script>

<!-- MODULE: Automatically deferred -->
<script type="module" src="/app.js"></script>
```

Fix 3: Preload the LCP Image (if applicable)

If your LCP element is an image, preload it so it doesn't wait for CSS/JS:

```
<link rel="preload" as="image" href="/hero.webp" fetchpriority="high">
```
